

Mediphan MedRecorder™ is a simple solution for the capture, archive, organization, and retrieval of diagnostic-quality medical images and DICOM images from nearly any medical device that has a video display (VGA or DVI). It is an effective low-volume picture archive and communication system (PACS) solution, and can also be used to enhance hospital security.

Recordings can be saved as videos or DICOM images and instantly uploaded to a PACS server. Furthermore, recordings are can be accessed through MedRecorder Portal, an intuitive web-based user interface that is included with every MedRecorder and requires no installation or special software. MedRecorder provides a complete solution for capturing, organizing, cataloguing and archiving medical images and videos.

Mediphan MedRecorder requires no special software, computer or computer monitor—just a standard USB 2.0 bus. Because it is an external device, medical professionals do not need to open their medical equipment to install it, and no software needs to be installed. Most individuals can be up and running with the MedRecorder solution quickly, without assistance from the IT department.
